1.4MHz, Low Power CMOS Operational Amplifiers

The ICL761X/762X/764X series is a family of monolithic CMOS operational amplifiers. These devices provide the designer with high performance operation at low supply voltages and selectable quiescent currents, and are an ideal design tool when ultra low input current and low power dissipation are desired.

The basic amplifier will operate at supply voltages ranging from $\pm 1V$ to $\pm 8V$, and may be operated from a single Lithium cell.

A unique quiescent current programming pin allows setting of standby current to 1mA, 100 μ A, or 10 μ A, with no external components. This results in power consumption as low as 20 μ W. The output swing ranges to within a few millivolts of the supply voltages.

Of particular significance is the extremely low (1pA) input current, input noise current of $0.01 pA/\sqrt{Hz}$, and $10^{12}\Omega$ input impedance. These features optimize performance in very high source impedance applications.

The inputs are internally protected. Outputs are fully protected against short circuits to ground or to either supply.

AC performance is excellent, with a slew rate of 1.6V/ μ s, and unity gain bandwidth of 1MHz at I_Q = 1mA.

Because of the low power dissipation, junction temperature rise and drift are quite low. Applications utilizing these features may include stable instruments, extended life designs, or high density packages.

Ordering Information

PART NUMBER	TEMP. RANGE (^o C)	PACKAGE	PKG. NO.
ICL7611BCPA	0 to 70	8 Ld PDIP - B Grade	E8.3
ICL7611DCPA	0 to 70	8 Ld PDIP - D Grade	E8.3
ICL7611DCBA	0 to 70	8 Ld SOIC - D Grade	M8.15
ICL7611DCBA-T	0 to 70	8 Ld SOIC - D Grade Tape and Reel	M8.15
ICL7612BCPA	0 to 70	8 Ld PDIP - B Grade	E8.3
ICL7612DCPA	0 to 70	8 Ld PDIP - D Grade	E8.3
ICL7612DCBA	0 to 70	8 Ld SOIC - D Grade	M8.15
ICL7612DCBA-T	0 to 70	8 Ld SOIC - D Grade Tape and Reel	M8.15

Features

•	Wide Operating	Voltage	Range		$\pm 1V$ to $\pm 8V$
---	----------------	---------	-------	--	----------------------

- Programmable Power Consumption Low as 20µW
- Input Current Lower Than BIFETs 1pA (Typ)
- Output Voltage Swing V+ and V-
- Input Common Mode Voltage Range Greater Than Supply Rails (ICL7612)

Applications

- Portable Instruments
- Telephone Headsets
- Hearing Aid/Microphone Amplifiers
- Meter Amplifiers
- Medical Instruments
- · High Impedance Buffers

Pinouts

Operating Conditions

Temperature Range

Thermal Information

Thermal Resistance (Typical, Note 3)	θ_{JA} (^o C/W)
PDIP Package	130
SOIC Package	
Maximum Junction Temperature (Plastic Package)	150 ⁰ C
Maximum Storage Temperature Range	^o C to 150 ^o C
Maximum Lead Temperature (Soldering 10s)	300 ⁰ C
(SOIC - Lead Tips Only)	

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

- 1. Long term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.
- The outputs may be shorted to ground or to either supply, for V_{SUPPLY} ≤10V. Care must be taken to insure that the dissipation rating is not exceeded.

3. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

Schematic Diagram

Application Information

Static Protection

All devices are static protected by the use of input diodes. However, strong static fields should be avoided, as it is possible for the strong fields to cause degraded diode junction characteristics, which may result in increased input leakage currents.

Latchup Avoidance

Junction-isolated CMOS circuits employ configurations which produce a parasitic 4-layer (PNPN) structure. The 4-layer structure has characteristics similar to an SCR, and under certain circumstances may be triggered into a low impedance state resulting in excessive supply current. To avoid this condition, no voltage greater than 0.3V beyond the supply rails may be applied to any pin. In general, the op amp supplies must be established simultaneously with, or before any input signals are applied. If this is not possible, the drive circuits must limit input current flow to 2mA to prevent latchup.

Choosing the Proper IQ

The ICL7611 and ICL7612 have a similar I_Q set-up scheme, which allows the amplifier to be set to nominal quiescent currents of 10µA, 100µA or 1mA. These current settings change only very slightly over the entire supply voltage range. The ICL7611/12 have an external I_Q control terminal, permitting user selection of quiescent current. To set the I_Q connect the I_Q terminal as follows:

 $I_Q = 10\mu A - I_Q pin to V+$

 I_Q = 100µA - I_Q pin to ground. If this is not possible, any voltage from V+ - 0.8 to V- +0.8 can be used.

 $I_Q = 1mA - I_Q pin to V-$

NOTE: The output current available is a function of the quiescent current setting. For maximum peak-to-peak output voltage swings into low impedance loads, IQ of 1mA should be selected.

Output Stage and Load Driving Considerations

Each amplifiers' quiescent current flows primarily in the output stage. This is approximately 70% of the I_Q settings. This allows output swings to almost the supply rails for output loads of $1M\Omega$, $100k\Omega$, and $10k\Omega$, using the output stage in a highly linear class A mode. In this mode, crossover distortion is avoided and the voltage gain is maximized. However, the output stage can also be operated in Class AB for higher output currents. (See graphs under Typical Operating Characteristics). During the transition from Class A to Class B operation, the output transfer characteristic is non-linear and the voltage gain decreases.

Input Offset Nulling

Offset nulling may be achieved by connecting a 25K pot between the BAL terminals with the wiper connected to V+. At quiescent currents of 1mA and 100 μ A the nulling range provided is adequate for all V_{OS} selections; however with

5

 I_Q = 10µA, nulling may not be possible with higher values of $V_{OS}.$

Frequency Compensation

The ICL7611 and ICL7612 are internally compensated, and are stable for closed loop gains as low as unity with capacitive loads up to 100pF.

Extended Common Mode Input Range

The ICL7612 incorporates additional processing which allows the input CMVR to exceed each power supply rail by 0.1V for applications where $V_{SUPP} \ge \pm 1.5V$. For those applications where $V_{SUPP} \le \pm 1.5V$ the input CMVR is limited in the positive direction, but may exceed the negative supply rail by 0.1V in the negative direction (e.g., for $V_{SUPPLY} = \pm 1V$, the input CMVR would be +0.6V to -1.1V).

Operation At V_{SUPPLY} = ±1V

Operation at $V_{SUPPLY} = \pm 1V$ is guaranteed at $I_Q = 10\mu A$ for A and B grades only.

Output swings to within a few millivolts of the supply rails are achievable for $R_L \geq 1M\Omega$. Guaranteed input CMVR is $\pm 0.6V$ minimum and typically +0.9V to -0.7V at $V_{\mbox{SUPPLY}} = \pm 1V$. For applications where greater common mode range is desirable, refer to the description of ICL7612 above.

Typical Applications

The user is cautioned that, due to extremely high input impedances, care must be exercised in layout, construction, board cleanliness, and supply filtering to avoid hum and noise pickup.

Note that in no case is I_Q shown. The value of I_Q must be chosen by the designer with regard to frequency response and power dissipation.

FIGURE 1. SIMPLE FOLLOWER (NOTE 4)

NOTE:

By using the ICL7612 in this application, the circuit will follow rail to rail inputs.

FIGURE 2. LEVEL DETECTOR (NOTE 4)

NOTE: Low leakage currents allow integration times up to several hours.

FIGURE 3. PHOTOCURRENT INTEGRATOR

FIGURE 5. AVERAGING AC TO DC CONVERTER FOR A/D CONVERTERS SUCH AS ICL7106, ICL7107, ICL7109, ICL7116, ICL7117

NOTE: Since the output range swings exactly from rail to rail, frequency and duty cycle are virtually independent of power supply variations.

FIGURE 4. PRECISE TRIANGLE/SQUARE WAVE GENERATOR

FIGURE 6. BURN-IN AND LIFE TEST CIRCUIT

FIGURE 7. VOS NULL CIRCUIT

NOTES:

- 5. Note that small capacitors (25pF to 50pF) may be needed for stability in some cases.
- 6. The low bias currents permit high resistance and low capacitance values to be used to achieve low frequency cutoff. $f_C = 10Hz$, $A_{VCL} = 4$, Passband ripple = 0.1dB.
