Rules For Safe Operation

⚠ Warning

To avoid possible electric shock or personal injury, and to avoid possible damage to the Meter or to the equipment under test, adhere to the following rules:

- **Before using the Meter inspect the case. Do not use the Meter if it is damaged or the case (or part of the case) is removed. Look for cracks or missing plastic. Pay attention to the insulation around the connectors.**
- **Inspect the test clips for damaged insulation or exposed metal. Check the test clips for continuity. Replace damaged test clips with identical model number or electrical specifications before using the Meter.**
- **Do not apply voltage to the Meter.**
- **The rotary switch should be placed in the right position and no any changeover of range shall be made during measurement is conducted to prevent damage of the Meter.**
- **Do not apply more than 30Vrms between the terminals and the grounding to avoid electric shock and damage to the Meter.**
- **Use the proper terminals, function, and range for your measurements.**
- **Do not use or store the Meter in an environment of high temperature, humidity, explosive, inflammable and strong magnetic field. The performance of the Meter may deteriorate after dampened.**
- **Disconnect circuit power and discharge all high-voltage capacitors before testing resistance, continuity, capacitance or diodes.**
- **Replace the battery as soon as the battery indicator appears. With a low battery, the Meter might produce false readings that can lead to electric shock and personal injury.**
- **Remove test clips from the Meter and turn the Meter power off before opening the Meter case.**

- **When servicing the Meter, use only the same model number or identical electrical specifications replacement parts.**
- **The internal circuit of the Meter shall not be altered at will to avoid damage of the Meter and any accident.**
- **Soft cloth and mild detergent should be used to clean the surface of the Meter when servicing. No abrasive and solvent should be used to prevent the surface of the Meter from corrosion, damage and accident.**
- **The Meter is suitable for indoor use.**
  Turn the Meter power off when it is not in use and take out the battery when not using for a long time.
- **Please constantly check the battery as it may leak when it has been using for some time, replace the battery as soon as leaking appears. A leaking battery will damage the Meter.**

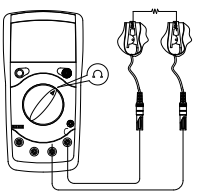
A. Measuring Resistance (see figure 3)



(figure 3)

⚠ Warning

To avoid damages to the Meter or to the devices under test, disconnect circuit power and discharge all the high-voltage capacitors before measuring resistance.

The resistance ranges are 20Ω, 200Ω, 2kΩ, 20kΩ, 200kΩ, 2MΩ, 20MΩ, 200MΩ and 2000MΩ.

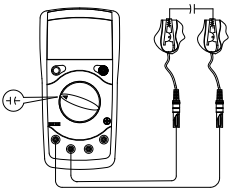
To measure resistance, please connect the Meter as follows:

1. Insert the red test clip into the Ω terminal and the black test clip into **COM** terminal.
2. Set the rotary switch to Ω range.
3. Connect the test clips across with the object being measured.
   The measured value shows on the display.

Note

- When measuring at 20Ω and 200Ω range, the test clips can add 0.1 to 0.3Ω error to resistance. To obtain precise readings in these low-resistance measurement, that is the range 20Ω and 200Ω, short circuit the input terminals beforehand and record the reading obtained (called this reading as X). (X) is the additional resistance from the test clips.
  Then use the equation:
  measured resistance value (Y) – (X) = precision readings of resistance.
- The Meter displays **"1"** when there is no input, for example, open circuit situation.
- For high resistance measurement (>1MΩ), it is normal taking several seconds to obtain a stable reading.
- When resistance measurement has been completed, disconnect the connection between the testing clips and the circuit under test and remove the testing clips away from the input terminals of the Meter.

B. Capacitance Measurement (see figure 4)



(figure 4)

⚠ **Warning**

To avoid damage to the Meter or to the equipment under test, disconnect circuit power and discharge all high-voltage capacitors before measuring capacitance. Use the DC Voltage function to confirm that the capacitor is discharged.

The Meter's capacitance ranges are:200pF, 2nF, 20nF, 200nF, 2μF, 20μF, 200μF, 2mF and 20mF.

To measure capacitance, connect the Meter as follows:

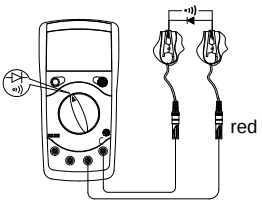
1. Set the rotary switch to **F** measurement mode. If the value of capacitor to be measured is unknown, use the minimum measurement position 200pF and increase the range step by step until a satisfactory reading is obtained and the overloading icon "**1**" is disappeared.
2. Insert the red test clip into the **CAP +** terminal and black test clip into the **CAP –** terminal. For small value capacitor measurement, insert the capacitor into the **Small Value Capacitance Jack.**
3. Use the red test clip to clip the capacitor's positive and the black test clip to clip the capacitor's negative when the capacitor has polarity.

4. When measuring small value capacitor, that is 200pF, 2nF and 20nF, first open circuit the test clips or the **Small Value Capacitance Jack,** then turn the **Capacitance Zero Adjustment Switch** to adjust zero.
5. The measured value shows on the display.

Note

- Do not short the test clips to avoid the consumption of battery.
- To minimize the effect of capacitance stored in the test clips, the test clips should be as short as possible and use the **Small Value Capacitance Jack** when measuring small value of capacitance.
- When capacitance measurement has been completed, disconnect the connection between the testing clips and the circuit under test and remove the testing clips away from the input terminals of the Meter.

C. Diode and Continuity Test (see figure 5)



(figure 5)

⚠ Warning

To avoid damages to the Meter or to the devices under test, disconnect circuit power and discharge all the high-voltage capacitors before measuring diodes and continuity.

Testing Diodes

Use the diode test to check diodes, transistors, and other semiconductor devices. The diode test sends a current through the semiconductor junction, and then measures the voltage drop across the junction. A good silicon junction drops between 0.5V and 0.8V.

To test a diode out of a circuit, connect the Meter as follows:

1. Insert the red test clip into the Ω terminal and the black test clip into the **COM** terminal.
2. Set the rotary switch to .
3. For forward voltage drop readings on any semiconductor component, place the red test clip on the component's anode and place the black test clip on the component's cathode.
   The display shows the diode forward voltage drop's nearest value.

Note

- In a circuit, a good diode should still produce a forward voltage drop reading of 0.5V to 0.8V; however, the reverse voltage drop reading can vary depending on the resistance of other pathways between the probe tips.
- Connect the test clips to the proper terminals as said above to avoid error display. The LCD will display "**1**" indicating open-circuit for wrong connection. The unit of diode is Volt (V), displaying the positive-connection voltage-drop value.
- When diode measurement has been completed, disconnect the connection between the testing clips and the circuit under test and remove the testing clips away from the input terminals of the Meter.

Testing for Continuity

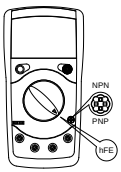
To test for continuity, connect the Meter as below:

1. Insert the red test clip into the Ω terminal and the black test clip into the **COM** terminal.
2. Set the rotary switch to .
3. Connect the test clips across with the object being measured.
4. The beeper comes on continuously when the test resistance <120Ω.
5. The Meter displays the value of the test resistance.

Note

- The LCD displays "**1"** indicating the circuit being tested is open.
- When continuity test has been completed, disconnect the connection between the testing clips and the circuit under test and remove the testing clips away from the input terminals of the Meter.

D. Transistor hFE Measurement (see figure 6)



(figure 6)

To measure transistor, set up the Meter as follows:

1. Check that the transistor is PNP or NPN type.
2. Insert the transistor to be measured to the corresponding **Transistor Jack**.
3. The Meter displays the tested transistor's nearest value.

Note

- When transistor measurement has been completed, disconnect the connection between the testing clips and the circuit under test and remove the testing clips away from the input terminals of the Meter.
