

PRE- Amplifier with vacuum tube AC12V

Basic parameters:

Both input and output are 6.5 mono ports.

There are level output control and gain control knobs.

Power supply voltage: DC12V

Maximum output: $\pm 2V$

Magnification: 80-150 times adjustable (according to microphone sensitivity)

Note:

There is a gain adjusting knob and an output level controlling knob. The gain knob is used to adjust the magnification and fine-tune the function. Output level Controls the output voltage so that the line input level of the mixer or sound card is too high and distortion occurs.
